When I first thought about life and a successful career I actually missed a small but important step. I haven't quite made it to the finish line yet, but my journey is not over. When measured by our immediate surroundings first, and often foremost, success can leave an outstanding impact. The natural method of impacting others is simple, so we don't have to change anything instead we simply have to share our pride. Through the course of natural selection and evolution we are witnesses to survival adaptation. I don't have any American ancestors so when I started maturing into an adult I felt the need to create my own legacy. Software, doesn't have permanence within society, contrary to other older philosophical opportunities and careers.

I feel aware of a need for African-American integration into software technology. Sharing our feelings can be a result of positive social media technology, therefore it is healthy to feel powerful after a result of self-integration. If justice, religion, and integrity are cornerstones for my own race of people, then I am prepared to challenge the idea of cyber-security with the current models of personal software. So that we can effect our own communities positively, then we must affect ourselves with pride. Knowing protocols, learning instructions, and creating templates are fundamentally enhanced with technology. While we use computer software on a daily basis, there is a piece of the big picture still missing that is used to codify emotional consensus groups.
That puzzle piece still missing is social media software.

Like a table-cloth pull or levitation type of magic trick, as consumers we are expected to adapt to attacks and other terrible ideas so that we take control of own personal cyber-security. I don't have any examples for America that represent tragic struggles against criminal behavior with a successful ending for that exact same story. Once the timeline of hacking initiates against Americans, then we become suspected agents of paralysis sometimes unknowingly. We might not realize that we have become victims until we attempt newer things if we never realized we were hacked in the beginning. For example, there is history of Kung-Fu that includes hero-class characters that use the same techniques as villains to teach a positive lesson at the end of a parables. The adaptation of technology in America is very fast-paced and has never been fair for people of color and people with ancestral ethnic descendants. In order to change the negativity associated in theft, destruction, and sabotage, our society has cliched labels of Black-Hat and White-Hat to describe software-security incidents. The problem is not within careers of cyber-security, however the problem exist because software was not created with the intention to integrate with my race of people.
Chinese Kung-Fu was first introduced into society in the dynasty era time periods before Christ. We can reflect on that chaotic time with modern martial arts styles that spread across oriental societies now called: Karate, Taekwondo, Krav Maga, and etc.

After school extra curricular programs, community outreach centers, churches, mosques, and temples are in a broad spectrum for places that host technology programs for American youth. Right now is the perfect chance to help distracted or exploited youth through philanthropy, mentorship, and charitable donations. How do we feel about the integration of software programs in our own neighborhoods; using software social media we can share our emotions and thoughts with the entire world.

Racism and software are an example of a combination of group census that doesn't require a specific victim so that it can target human beings. When a business merger happens in the stock market consumer focus groups use paradigm-shifts to dismantle alignments that shift the equilibrium point for the global internet. This affect of exploitation is able to hurt anyone and everyone in society, we call it hacking. Now that negative emotions are congruently construed with

violence, specifically American gun violence, criminal behavior, and sabotage, society has adapted into accepting hacking into our own personal lifestyles. We are taught to protect our personal cyber-software with passwords and security that should not effect individual human beings. Without entrepreneurship and without business there is no power against hacking. Too often our senior-citizens become the target or victim of hacking and cyber-espionage.

Technology is the application of scientific knowledge for industry specific inflation for stock brokers, investors, and professionals. Electrical engineering can latter include open source-code entertainment and open-source code information. Relationships also include time in order to better cooperate with coherent and professional business. Unfortunately, in America adults have autism for etiquette, configurations, and correct settings. Also, when we use operating system computer software there is a total liability for comprehensive failure. Software is transparent and also open to the public, for nano-cyber-technology as pure form electricity in the format of: information, technology, and data.

I am striving to become independent. Leadership requires independence. I want to achieve independence on a very broad horizon. I want to see pride in my daily lifestyle and feel successful when I look at my surroundings. I want you to to update your software with my code that is compatible with frameworks, security, and technology. I want my community to feel almighty in the advent of business. I want you to feel proud of my work. I want you to feel powerful as your own leader. I want you to remember me as a leader with a proud personality from online networking data in a modern world of hacking and software.
